I. INTRODUCTION

A. PROJECT DESCRIPTION AND LOCATION (Figure No. 1)

This report has been prepared to evaluate the potential traffic impacts associated with the proposed redevelopment of 511 Fishkill Avenue as a Multi-Use commercial development. The site is located on the northwest side of NYS Route 52 (Fishkill Avenue), southwest of Prospect Street in the City of Beacon, Dutchess County, New York. The redevelopment is proposed to consist of a 37,247 square foot brewery, a 72,248 square foot warehouse, a 11,381 square foot arcade, 2,296 square feet of office space, and a 4,965 square foot event space. As shown on Figure No. 1, access to the development is proposed to be provided via the existing driveway connection to Fishkill Avenue, which is located approximately 670 feet southwest of Prospect Street.

A Design Year of 2024 has been utilized in completing the traffic analysis in order to evaluate future traffic conditions associated with this proposed development.

B. SCOPE OF STUDY

This study has been prepared to identify current and future traffic operating conditions on the surrounding roadway network and to assess the potential traffic impacts of the proposed 511 Fishkill Avenue Multi-Use Redevelopment.

All available traffic count data for the study area intersections were obtained from previous reports prepared by our office and other studies completed for the City of Beacon for this area. These data were supplemented with new traffic counts collected by representatives of Maser Consulting, P.A. These data were also compared to count data obtained from the New York State Department of Transportation (NYSDOT). Together these data were utilized to establish the Year 2019 Existing Traffic Volumes representing existing traffic conditions in the vicinity of the site.

The Year 2019 Existing Traffic Volumes were then projected to the 2024 Design Year to take into account background traffic growth as well as traffic from any other potential or approved developments in the area.

Estimates were then made of the potential traffic that the proposed development would generate during each of the peak hours (see Section III-B for further discussion). These volumes were then added to the roadway system based on anticipated arrival and departure

distributions and combined with the Year 2024 No-Build Traffic Volumes resulting in the Year 2024 Build Traffic Volumes.

The Existing, No-Build and Build Traffic Volumes were then compared to roadway capacities based on the procedures from the Highway Capacity Manual to determine existing and future Levels of Service.

II. EXISTING ROADWAY AND TRAFFIC DESCRIPTIONS

A. DESCRIPTION OF EXISTING ROADWAYS

As shown on Figure No. 1, the proposed 511 Fishkill Avenue Redevelopment will be accessed from NYS Route 52 (Fishkill Avenue). The following is a brief description of the roadways located within the study area. In addition, Section III-F provides a further description of the existing geometrics, traffic control and a summary of the existing and future Levels of Service and any recommended improvements for each of the study area intersections. Appendix "D" contains copies of the capacity analyses, which indicate the existing geometrics (including lane widths) and other characteristics for each of the individual intersections studied.

1. NYS Route 52 (Fishkill Avenue)

NYS Route 52 (Fishkill Avenue) is classified as an Urban Minor Arterial roadway in the study area under New York State Department of Transportation (NYSDOT) jurisdiction. The roadway generally traverses in a northeasterly direction throughout Southern Dutchess County. In the vicinity of the site the roadway provides regional access to I-84 and the downtown Beacon Main Street area. The roadway generally consists of a two-lane cross-section in the immediate area of the project site with additional auxiliary lanes provided at various intersections, including at the Red Schoolhouse Road intersection. The posted speed limit is 30 mph in the City of Beacon and 40 mph in the Town of Fishkill. Sidewalk is provided along the west side of the roadway in the vicinity of the site.

2. Red Schoolhouse Road

Red Schoolhouse Road is a Town roadway under the jurisdiction of the Town of Fishkill that originates at an unsignalized "T-shaped" intersection with Old Glenham Road. The roadway traverses in a northerly direction and provides access to several residential single-family homes. The roadway is approximately 22 feet wide providing a single lane in each direction with a speed limit of 40 mph.

3. Prospect Street

Prospect Street is a Town roadway under the jurisdiction of the Town of Fishkill that originates at an unsignalized "T-shaped" intersection with NYS Route 52 approximately 670 feet northeast of the site. The roadway traverses in a northwesterly direction and provides access to several single-family homes, as well as the Fishkill Correctional Facility. The roadway is approximately 22 feet wide providing a single lane in each direction with a speed limit of 30 mph.

4. Mill Street

Mill Street is a City roadway under the jurisdiction of the City of Beacon that originates at a “stop” sign controlled “T-shaped” intersection with Fishkill Avenue controlled by a flashing traffic signal. The roadway traverses in a southeasterly direction and provides access to various residential uses. The roadway is approximately 25 feet wide providing a single lane in each direction with a speed limit of 30 mph. There is also an existing unsignalized train crossing of Mill Street approximately 20 feet from the NYS Route 52 intersection.

B. YEAR 2019 EXISTING TRAFFIC VOLUMES (Figures No. 2 through 4)

Manual traffic counts and pedestrian counts were collected by representatives of Maser Consulting, P.A. on January 17, 2019 for the weekday AM and PM peak periods and on January 19, 2019 for the Saturday peak period. The traffic counts were then compared to traffic volume data from previous traffic studies conducted by our office and for the City of Beacon as well as traffic volume data available from the New York State Department of Transportation (NYSDOT) for the NYS Route 52 Corridor. Based on this information, the Year 2019 Existing Traffic Volumes were established for the Weekday Peak AM, Weekday Peak PM and Saturday Peak Hours at the following study area intersections.

- NYS Route 52 and Red Schoolhouse Road
- NYS Route 52 and Prospect Street
- NYS Route 52 and Hudson Baylar Beacon Driveway/Site Access
- NYS Route 52 and Mill Street

Based upon a review of the traffic counts, the peak hours were generally identified as follows:

- | | |
|------------------------|-------------------|
| ▪ Weekday Peak AM Hour | 8:00 AM – 9:00 AM |
| ▪ Weekday Peak PM Hour | 3:45 PM – 4:45 PM |
| ▪ Saturday Peak Hour | 1:00 PM – 2:00 PM |

The resulting Year 2019 Existing Traffic Volumes are shown on Figures No. 2, 3 and 4 for the Weekday Peak AM Hour, Weekday Peak PM Hour and Saturday Peak Hour respectively.

III. EVALUATION OF FUTURE TRAFFIC CONDITIONS

A. YEAR 2024 NO-BUILD TRAFFIC VOLUMES (Figure No. 5 through 7)

The Year 2019 Existing Traffic Volumes were increased by a growth factor of 2.0% per year to account for general background growth in the area. This growth factor is considered conservatively high based on historical data from NYSDOT, which indicates a much lower growth level. However, this growth rate also accounts for any other potential or proposed developments in the area not specifically identified in this study. The resulting Year 2024 No-Build Traffic Volumes are shown on Figures No. 5, 6 and 7 for the Weekday Peak AM, Weekday Peak PM and Saturday Peak Hours, respectively.

B. SITE GENERATED TRAFFIC VOLUMES (Tables No. 1)

Estimates of the amount of traffic to be generated by the proposed development during each of the peak hours were developed based on information published by the Institute of Transportation Engineers (ITE) as contained in the report entitled “Trip Generation”, 10th Edition, 2017, based on Land Use Category – 110 – Light Industrial Warehouse for the brewery, Land Use Category – 150 – Warehousing for the warehouse use, Land Use Category – 495 – Recreational Community Center for the Arcade use, and Land Use Category – 710 – General Office Building for the office use. Additionally, trip generation estimates were based on data obtained from Spack Consulting Open Source Trip Generation Data Q3, 2018 for the event space. Table No. 1 summarizes the trip generation rates and corresponding site generated traffic volumes for the Weekday Peak AM, Weekday Peak PM and Saturday Peak Hours.

C. ARRIVAL AND DEPARTURE DISTRIBUTIONS (Figures No. 8 and 9)

Arrival and departure distributions were established to assign the site generated traffic volumes to the surrounding roadway network. Based on a review of the Existing Traffic Volumes and the expected travel patterns on the surrounding roadway network the distributions were identified. The resulting arrival and departure distributions are shown on Figures No. 8 and 9, respectively.

D. 2024 BUILD CONDITIONS TRAFFIC VOLUMES (Figures No. 10 through 15)

The site generated traffic volumes were assigned to the roadway network based on the arrival and departure distributions referenced above. The resulting site generated traffic volumes for each of the study area intersections are shown on Figures No. 10, 11 and 12 for each of the peak hours, respectively. The site generated traffic volumes were then added to the Year 2024 No-Build Traffic Volumes to obtain the Year 2024 Build Traffic Volumes. The resulting Year 2024 Build Traffic Volumes are shown on Figures No. 13, 14 and 15 for the Weekday Peak AM, Weekday Peak PM and Saturday Peak Hours, respectively.

E. DESCRIPTION OF ANALYSIS PROCEDURES

It was necessary to perform capacity analyses to determine existing and future traffic operating conditions at the study area intersections. The following is a brief description of the analysis method utilized in this report:

- Signalized Intersection Capacity Analysis

The capacity analysis for a signalized intersection was performed in accordance with the procedures described in the *Highway Capacity Manual, 6th Edition*, published by the Transportation Research Board. The terminology used in identifying traffic flow conditions is Levels of Service. A Level of Service “A” represents the best condition and a Level of Service “F” represents the worst condition. A Level of Service “C” is generally used as a design standard while a Level of Service “D” is acceptable during peak periods. A Level of Service “E” represents an operation near capacity. In order to identify an intersection’s Level of Service, the average amount of vehicle delay is computed for each approach to the intersection as well as for the overall intersection.

- Unsignalized Intersection Capacity Analysis

The unsignalized intersection capacity analysis method utilized in this report was also performed in accordance with the procedures described in the *Highway Capacity Manual, 6th Edition*. The procedure is based on total elapsed time from when a vehicle stops at the end of the queue until the vehicle departs from the stop line. The average total delay for any particular critical movement is a function of the service rate or capacity of the approach and the degree of saturation. In order to identify the Level of

Service, the average amount of vehicle delay is computed for each critical movement to the intersection.

Additional information concerning signalized and unsignalized Levels of Service can be found in Appendix "C" of this report.

F. RESULTS OF ANALYSIS (Table No. 2)

Capacity analyses, which take into consideration appropriate truck percentages, pedestrian activity, roadway grades and other factors, were performed at the study area intersections utilizing the procedures described above and the Synchro Version 10 analysis software to determine the Levels of Service and average vehicle delays. Summarized below are a description of the existing geometrics, traffic control and a summary of the existing and future Levels of Service as well as any recommended improvements.

Table No. 2 summarizes the results of the capacity analysis for the 2019 Existing, 2024 No-Build and 2024 Build. Appendix "D" contains copies of the capacity analyses which also indicate the existing geometrics (including lane widths) and other characteristics for each of the individual intersections studied.

1. NYS Route 52 (Fishkill Avenue) and Red Schoolhouse Road

Red Schoolhouse Road intersects NYS Route 52 at a signalized full movement intersection. The eastbound NYS Route 52 approach consists of a 235-foot long left turn lane and a shared through/right turn lane. The westbound NYS Route 52 approach consists of a 75-foot left turn lane and a shared through/right turn lane. The northbound Red Schoolhouse Road approach consists of one shared left/through/right lane. The southbound Red Schoolhouse Road approach consists of a 135-foot long right turn lane and a shared through/right turn lane.

Capacity analysis was conducted for this intersection utilizing the 2019 Existing Traffic Volumes. The analysis results indicate that the intersection is currently operating at an overall Level of Service "C" during the AM Peak Hour and at an overall Level of Service "B" during the PM Peak Hour and Saturday Peak Hour.

The capacity analysis was recomputed using the 2024 No-Build and 2024 Build Traffic Volumes. These results indicate that the intersection is expected to continue to operate at an overall Level of Service "C" during the AM Peak Hour and at an overall Level of Service "B" during the PM Peak Hour and Saturday Peak Hour both with and without the project. It should be noted that the Red Schoolhouse Road approaches are expected

to experience longer delays in the future regardless of the project. Therefore, an analysis was conducted for each of the time periods with potential signal timing modifications that could be implemented in order to improve operating conditions at the intersection, specifically on the Red Schoolhouse Road approaches. The analyses with these signal timing modifications indicates that the intersection will operate at an overall Level of Service “B” across all peak hours with improved operation on the Red Schoolhouse Road approaches. These signal timing modifications would require review and approval by the NYSDOT, but could be considered regardless of the project.

2. NYS Route 52 (Fishkill Avenue) and Prospect Street

Prospect Street intersects NYS Route 52 at an unsignalized “T-shaped” intersection. All approaches to the intersection consist of one lane and sight distances are good for all approaches. Sidewalk is provided along the west side of NYS Route 52 south of this intersection.

Capacity analysis was conducted for this intersection utilizing the 2019 Existing Traffic Volumes. The analysis results indicate that the intersection is currently operating at a Level of Service “D” or better during the AM Peak Hour and PM Peak Hour, and at a Level of Service “C” or better during the Saturday Peak Hour.

The capacity analysis was recomputed using the 2024 No-Build and Build Traffic volumes. These results indicate that the intersection is expected to operate at a Level of Service “E” or better during the AM Peak Hour and PM Peak Hour, and at a Level of Service “C” or better during the Saturday Peak Hour both with and without the project.

3. NYS Route 52 (Fishkill Avenue) and Hudson Baylar Beacon Driveway/Site Access

The Hudson Baylar Beacon Driveway and the 511 Fishkill Site Access both intersect NYS Route 52 at unsignalized intersections offset approximately 100 feet from each other. Due to their proximity, these intersections tend to function as a single, full lane movement intersection. All approaches to the intersection consist of one lane and sight distances are good for all approaches. Sidewalk is provided on the west side of the NYS Route 52 southbound approach. Note that there is also an existing unsignalized train crossing of the Hudson Baylar Beacon driveway approximately 20 feet east of the NYS Route 52 intersection.

Capacity analysis was conducted for this intersection utilizing the 2019 Existing Traffic Volumes. The analysis results indicate that the intersection is currently operating at a Level of Service “B” or better during the AM Peak Hour, and at a Level of Service “C”

or better during the PM Peak Hour and Saturday Peak Hour. The capacity analysis was recomputed using the 2024 No-Build Traffic Volumes, which indicated that similar Levels of Service would be maintained in the future without the proposed project.

The capacity analysis was again recomputed using the 2024 Build Traffic Volumes. These results indicate that the intersection is expected to operate at a Level of Service “C” or better during the AM Peak Hour and Saturday Peak Hour, and at a Level of Service “D” or better during the PM Peak Hour. Note that the sidewalk curb ramps at the site driveway should be reviewed to determine if they meet ADA requirements, especially the curb ramp on the south side of the driveway. Any modifications to the driveway or existing sidewalk will require a NYSDOT Highway Work Permit.

4. NYS Route 52 and Mill Street

Mill Street intersects NYS Route 52 at an unsignalized “T-shaped” intersection that is controlled by a flashing traffic signal. All approaches to the intersection consist of one lane and sight distances are good for all approaches. Striped pedestrian crosswalks are provided on both the southwest bound NYS Route 52 approach and the Mill Street approach. Sidewalk is provided along the west side of NYS Route 52 in the immediate vicinity of this intersection. Note that there is also an existing unsignalized train crossing of Mill Street approximately 20 feet east of the NYS Route 52 intersection.

Capacity analysis was conducted for this intersection utilizing the 2019 Existing Traffic Volumes. The analysis results indicate that the intersection is currently operating at a Level of Service “C” or better during the AM Peak Hour, PM Peak Hour and Saturday Peak Hour.

The capacity analysis was recomputed using the 2024 No-Build Traffic Volumes. These results indicate that the intersection is expected to continue to operate at a Level of Service “C” or better during the AM Peak Hour and Saturday Peak Hour, while a Level of Service “D” or better will be experienced during the PM Peak Hour.

The capacity analysis was recomputed using the 2024 Build Traffic Volumes. These results indicate that the intersection is expected to continue to operate at a Level of Service “C” or better during the AM Peak Hour, and at Level of Service “D” or better during the PM Peak Hour and Saturday Peak Hour. Note that regardless of the proposed project, a “stop” sign and solid white stop bar striping should be installed on the Mill Street approach for conformance with the requirements of the Manual on Uniform Traffic Control Devices (MUTCD) for a flashing traffic signal-controlled intersection.

IV. SUMMARY AND CONCLUSION

As indicated above, similar Levels of Service and delays will be experienced at the area intersections under the future No-Build and Build Conditions. Therefore, it is concluded that the 511 Fishkill Avenue Redevelopment project generated traffic is not expected to result in any significant impacts to traffic operating conditions in the vicinity of the site.

APPENDIX C

LEVEL OF SERVICE STANDARDS

LEVEL OF SERVICE STANDARDS

LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS

Level of Service (LOS) can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach. Control delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control. It is also a measure of driver discomfort and fuel consumption. The volume-to-capacity ratio quantifies the degree to which a phase's capacity is utilized by a lane group.

LOS A describes operations with a control delay of 10 s/veh or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B describes operations with control delay between 10 and 20 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C describes operations with control delay between 20 and 35 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate.

LOS D describes operations with control delay between 35 and 55 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long.

LOS E describes operations with control delay between 55 and 80 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long.

LOS F describes operations with control delay exceeding 80 s/veh or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long.

A lane group can incur a delay less than 80 s/veh when the volume-to-capacity ratio exceeds 1.0. This condition typically occurs when the cycle length is short, the signal progression is favorable, or both. As a result, both the delay and volume-to-capacity ratio are considered when lane group LOS is established. A ratio of 1.0 or more indicates that cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 s/veh represents failure from a delay perspective).

The Level of Service Criteria for signalized intersections are given in Exhibit 19-8 from the *Highway Capacity Manual, 6th Edition* published by the Transportation Research Board.

Exhibit 19-8

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c ≤ 1.0	v/c > 1.0
≤10	A	F
>10-20	B	F
>20-35	C	F
>35-55	D	F
>55-80	E	F
>80	F	F

For approach-based and intersection wide assessments, LOS is defined solely by control delay.

LEVEL OF SERVICE CRITERIA

FOR TWO-WAY STOP-CONTROLLED (TWSC) UNSIGNALIZED INTERSECTIONS

Level of Service (LOS) for a two-way stop-controlled (TWSC) intersection is determined by the computed or measured control delay. For motor vehicles, LOS is determined for each minor-street movement (or shared movement) as well as major-street left turns. LOS is not defined for the intersection as a whole or for major-street approaches.

The Level of Service Criteria for TWSC unsignalized intersections are given in Exhibit 20-2 from the *Highway Capacity Manual, 6th Edition* published by the Transportation Research Board.

Exhibit 20-2

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c ≤ 1.0	v/c > 1.0
0-10	A	F
>10-15	B	F
>15-25	C	F
>25-35	D	F
>35-50	E	F
>50	F	F

The LOS criteria apply to each lane on a given approach and to each approach on the minor street.

LOS is not calculated for major-street approaches or for the intersection as a whole.

As Exhibit 20-2 notes, LOS F is assigned to the movement if the volume-to-capacity ratio for the movement exceeds 1.0, regardless of the control delay.

The Level of Service Criteria for unsignalized intersections are somewhat different from the criteria for signalized intersections.

LEVEL OF SERVICE CRITERIA

FOR ALL-WAY STOP-CONTROLLED (AWSC) UNSIGNALIZED INTERSECTIONS

The Levels of Service (LOS) for all-way stop-controlled (AWSC) intersections are given in Exhibit 21-8. As the exhibit notes, LOS F is assigned if the volume-to-capacity (v/c) ratio of a lane exceeds 1.0, regardless of the control delay. For assessment of LOS at the approach and intersection levels, LOS is based solely on control delay.

The Level of Service Criteria for AWSC unsignalized intersections are given in Exhibit 21-8 from the *Highway Capacity Manual, 6th Edition* published by the Transportation Research Board.

Exhibit 21-8

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c \leq 1.0	v/c > 1.0
0-10	A	F
>10-15	B	F
>15-25	C	F
>25-35	D	F
>35-50	E	F
>50	F	F

For approaches and intersection wide assessment, LOS is defined solely by control delay.
