I. INTRODUCTION

A. PROJECT DESCRIPTION AND LOCATION (Figure No. 1)

This report has been prepared to evaluate the potential traffic impacts associated with the River Ridge residential development, which is planned to be developed on property located on the west side of NYS Route 9D opposite Rombout Avenue in the City of Beacon, Dutchess County, New York. The development, which is adjacent to the existing Reformed Church of Beacon, is proposed to consist of 18 residential townhome units. As shown on Figure No. 1, access to the development is proposed to be provided via a new driveway connection to NYS Route 9D located opposite Rombout Avenue.

A Design Year of 2022 has been utilized in completing the traffic analysis in order to evaluate future traffic conditions associated with this proposed development.

B. SCOPE OF STUDY

This study has been prepared to identify current and future traffic operating conditions on the surrounding roadway network and to assess the potential traffic impacts of the proposed River Ridge residential development.

All available traffic count data for the study area intersections were obtained from previous reports prepared by our office and other studies completed for the City of Beacon for this area. These data were supplemented with new traffic counts collected by representatives of Maser Consulting, P.A. These data were also compared to count data obtained from the New York State Department of Transportation (NYSDOT). Together these data were utilized to establish the Year 2017 Existing Traffic Volumes representing existing traffic conditions in the vicinity of the site.

The Year 2017 Existing Traffic Volumes were then projected to the 2022 Design Year to take into account background traffic growth as well as traffic from any other potential or approved developments in the area.

Estimates were then made of the potential traffic that the proposed development would generate during each of the peak hours (see Section III-B for further discussion). These volumes were then added to the roadway system based on anticipated arrival and departure distributions and combined with the Year 2022 No-Build Traffic Volumes resulting in the Year 2022 Build Traffic Volumes.

The Existing, No-Build and Build Traffic Volumes were then compared to roadway capacities based on the procedures from the Highway Capacity Manual to determine existing and future Levels of Service and operating conditions. Recommendations for improvements were made where necessary to serve the existing and/or future traffic volumes.

II. EXISTING ROADWAY AND TRAFFIC DESCRIPTIONS

A. DESCRIPTION OF EXISTING ROADWAYS

As shown on Figure No. 1, the proposed River Ridge residential development will be accessed from NYS Route 9D via a proposed driveway connection opposite Rombout Avenue. The proposed access driveway will serve both entering and exiting movements. The following is a brief description of the roadways located within the study area. In addition, Section III-F provides a further description of the existing geometrics, traffic control and a summary of the existing and future Levels of Service and any recommended improvements for each of the study area intersections. Appendix "D" contains copies of the capacity analyses, which indicate the existing geometrics (including lane widths) and other characteristics for each of the individual intersections studied.

1. NYS Route 9D

NYS Route 9D is classified as a Principal Arterial Other roadway under New York State Department of Transportation (NYSDOT) jurisdiction. The roadway generally traverses in a north/south direction throughout Putnam and Southern Dutchess Counties. In the vicinity of the site the roadway provides regional access to I-84, the Main Street area and the Beacon Train Station. The roadway generally consists of a three lane cross-section in the immediate area of the project site with additional lanes provided in the vicinity of the I-84 interchange. The posted speed limit is 30 mph and sidewalks are provided along both sides of the roadway.

2. Beekman Street

Beekman Street is a City roadway that originates at a signalized full movement intersection with NYS Route 9D opposite West Church Street. The roadway traverses in a southwesterly direction, providing access to the Beacon/Metro-North train station. In addition to parking at the station, on-street metered parking is provided along Beekman Street. This roadway also provides access to Dia Beacon and terminates at an unsignalized intersection with Wolcott Avenue (Route 9D). The speed limit for the roadway is 20 mph from Ferry Street to Hammond Plaza and 25 mph between the railroad bridge and Wolcott Avenue. Sidewalks are located along the entire roadway in some sections alternating sides of the roadway, but closer to Main Street they are provided on both sides of the roadway.

3. West Church Street

West Church Street is a City roadway that originates at a signalized full movement intersection with NYS Route 9D opposite Beekman Street. The roadway traverses in an easterly direction, providing access to various residential uses and terminating at an unsignalized intersection with Cross Street. It consists of a single lane in each direction with a speed of 30 mph and sidewalks on both sides of the roadway.

4. Main Street

Main Street is a City roadway that originates at a signalized full movement intersection with NYS Route 9D opposite Municipal Place. The roadway traverses in an easterly direction, providing access to various commercial and residential uses. It consists of a single lane in each direction, however at its intersection with NYS Route 9D, the westbound Main Street approach consists of a shared left and through lane and a right turn lane. The roadway has a speed limit of 25 mph and sidewalks on both sides of the roadway. It should be noted that there is 2-hour street parking on both sides of the roadway.

5. Rombout Avenue

Rombout Avenue is a City roadway that originates at an unsignalized intersection with NYS Route 9D. The roadway traverses in a southeasterly direction, providing access to mainly residential uses and terminating beyond Teller Avenue at John Street. It consists of a single lane in each direction with a speed limit of 30 mph. It should be noted that the section of Rombout Avenue between NYS Route 9D and South Avenue does not have sidewalks on either side of the street.

B. YEAR 2017 EXISTING TRAFFIC VOLUMES (Figures No. 2. and 3)

Manual traffic counts and pedestrian counts were collected by representatives of Maser Consulting, P.A. on Tuesday March 7, 2017, Wednesday March 8, 2017 and Thursday March 9, 2017, while schools were in session. These were also supplemented with counts collected on Thursday July 20, 2017 and Tuesday July 25, 2017 during the weekday AM and PM peak periods for the NYS Route 9D/Rombout Avenue intersection. These traffic volume data, which are provided in Appendix "E" for reference, were used to determine the existing traffic volume conditions at the study area intersections. The traffic counts were then compared to traffic volume data from previous traffic studies conducted by our office and for the City of Beacon as well as traffic volume data available from the New York State Department of Transportation (NYSDOT) for the NYS Route 9D Corridor. Based on this information, the Year 2017 Existing Traffic Volumes were established for the Weekday Peak AM and Weekday Peak PM Hours at the following study area intersections.

- NYS Route 9D and Beekman Street/West Church Street
- NYS Route 9D and Main Street/Municipal Place
- NYS Route 9D and Rombout Avenue

Based upon a review of the traffic counts, the peak hours were generally identified as follows:

- | | |
|------------------------|-------------------|
| ▪ Weekday Peak AM Hour | 7:30 AM – 8:30 AM |
| ▪ Weekday Peak PM Hour | 5:00 PM – 6:00 PM |

The resulting Year 2017 Existing Traffic Volumes are shown on Figures No. 2 and 3 for the Weekday Peak AM Hour and Weekday Peak PM Hour, respectively. It should be noted that due to the time of year the counts were collected for the Rombout Avenue intersection, it was necessary to seasonally adjust the traffic volumes for this intersection to be representative of typical conditions when schools are in session. This was done utilizing the March 2017 traffic counts for the Beekman Street/Church Street and Main Street/Municipal Plaza intersections as well as the available NYSDOT traffic volume data for comparison. The volumes shown on the 2017 Existing Traffic Volume figures reflect these adjustments.

III. EVALUATION OF FUTURE TRAFFIC CONDITIONS

A. YEAR 2022 NO-BUILD TRAFFIC VOLUMES (Figure No. 4 through 9)

The Year 2017 Existing Traffic Volumes were increased by a growth factor of 2.0% per year to account for general background growth in the area. The resulting Year 2022 Projected Traffic Volumes are shown on Figures No. 4 and 5 for the Weekday Peak AM and Weekday Peak PM Hours, respectively. In addition, traffic for the proposed 555 South Avenue project, the currently under construction Views development, the proposed Edgewater Development, and the proposed West End Lofts Development, was also accounted for. The traffic volumes associated with these Other Developments are summarized on Figures No. 6 and 7. These Other Development Traffic Volumes were then added to the 2022 Projected Traffic Volumes resulting in the 2022 No-Build Traffic Volumes, which are summarized on Figure No. 8 and 9 for each of the peak hours.

B. SITE GENERATED TRAFFIC VOLUMES (Tables No. 1)

Estimates of the amount of traffic to be generated by the proposed development during each of the peak hours were developed based on information published by the Institute of Transportation Engineers (ITE) as contained in the report entitled “Trip Generation”, 9th Edition, 2012, based on Land Use Category – 230 – Townhome. Table No. 1 summarizes the trip generation rates and corresponding site generated traffic volumes for the Weekday Peak AM and Peak PM Hours. Based on this, the development could generate a total of 15 vehicle trips during the highest peak one hour period.

It should be noted that due to the proximity of the proposed River Ridge residential development to the Beacon Metro North Train Station, it is expected that a portion of the morning and evening peak hour trips generated by the site would actually occur as pedestrian trips to and from the train station. These trips would utilize the existing sidewalk system in order to access the train station. In addition, the provision of a more direct pedestrian connection from the site to Beekman Street in the vicinity of River Street should be explored to further facilitate pedestrian access to the train. Based on the U.S. Census Bureau data, approximately 8.7% of the population in the City of Beacon currently use public transportation as a means of transportation to work, however the percentage of residents using public transportation from this development is expected to

be somewhat higher. Regardless, in order to provide a conservative analysis, no credit for public transportation/walking trips has been taken in the analysis contained herein.

C. ARRIVAL AND DEPARTURE DISTRIBUTIONS (Figures No. 10 and 11)

Arrival and departure distributions were established to assign the site generated traffic volumes to the surrounding roadway network. Based on a review of the Existing Traffic Volumes and the expected travel patterns on the surrounding roadway network and proposed internal roadway layout and access connections, the distributions were identified. The anticipated arrival and departure distributions are shown on Figures No. 10 and 11, respectively.

D. 2022 BUILD CONDITIONS TRAFFIC VOLUMES (Figures No. 12 through 15)

The site generated traffic volumes were assigned to the roadway network based on the arrival and departure distributions referenced above. The resulting site generated traffic volumes for each of the study area intersections are shown on Figures No. 12 and 13 for each of the peak hours, respectively. The site generated traffic volumes were then added to the Year 2022 No-Build Traffic Volumes to obtain the Year 2022 Build Traffic Volumes. The resulting Year 2022 Build Traffic Volumes are shown on Figures No. 14 and 15 for the Weekday Peak AM and Weekday Peak PM Hours, respectively.

E. DESCRIPTION OF ANALYSIS PROCEDURES

It was necessary to perform capacity analyses to determine existing and future traffic operating conditions at the study area intersections. The following is a brief description of the analysis method utilized in this report:

- Signalized Intersection Capacity Analysis

The capacity analysis for a signalized intersection was performed in accordance with the procedures described in the *2010 Highway Capacity Manual*, published by the Transportation Research Board. The terminology used in identifying traffic flow conditions is Levels of Service. A Level of Service “A” represents the best condition and a Level of Service “F” represents the worst condition. A Level of Service “C” is generally used as a design standard while a Level of Service “D” is

acceptable during peak periods. A Level of Service “E” represents an operation near capacity. In order to identify an intersection’s Level of Service, the average amount of vehicle delay is computed for each approach to the intersection as well as for the overall intersection.

▪ **Unsignalized Intersection Capacity Analysis**

The unsignalized intersection capacity analysis method utilized in this report was also performed in accordance with the procedures described in the *2010 Highway Capacity Manual*. The procedure is based on total elapsed time from when a vehicle stops at the end of the queue until the vehicle departs from the stop line. The average total delay for any particular critical movement is a function of the service rate or capacity of the approach and the degree of saturation. In order to identify the Level of Service, the average amount of vehicle delay is computed for each critical movement to the intersection.

Additional information concerning signalized and unsignalized Levels of Service can be found in Appendix “C” of this report.

F. **RESULTS OF ANALYSIS (Table No. 2)**

Capacity analyses, which take into consideration appropriate truck percentages, pedestrian activity, roadway grades and other factors, were performed at the study area intersections utilizing the procedures described above and the Synchro Version 8 analysis software to determine the Levels of Service and average vehicle delays. Summarized below are a description of the existing geometrics, traffic control and a summary of the existing and future Levels of Service as well as any recommended improvements.

Table No. 2 summarizes the results of the capacity analysis for the 2017 Existing, 2022 No-Build and 2022 Build Conditions. Appendix “D” contains copies of the capacity analyses which also indicate the existing geometrics (including lane widths) and other characteristics for each of the individual intersections studied.

1. **NYS Route 9D and Beekman Street/West Church Street**

Beekman Street intersects NYS Route 9D at a signalized full movement intersection opposite West Church Street. The eastbound Beekman Street approach consists of a shared left and through lane and also a right turn lane. The westbound West Church Street approach consists of a shared left, through and right turn lane. The northbound

NYS Route 9D approach consists of a left turn lane and a shared through and right turn lane. The southbound NYS Route 9D approach also consists of a left turn lane and a shared through and right turn lane. There are sidewalks on both sides of all approaches with a signalized pedestrian crossing of the southbound approach and unsignalized pedestrian crossings at the eastbound and westbound approaches. Site distances are good for all approaches.

Capacity analysis was conducted for this intersection utilizing the 2017 Existing Traffic Volumes. The analysis results indicate that the intersection is currently operating at an overall Level of Service “B” during the AM Peak Hour and at an overall Level of Service “C” during the PM Peak Hour.

As part of the Traffic Impact Studies completed for the proposed Edgewater and West End Lofts developments, minor signal timing modifications were proposed for this intersection in order to address future operating conditions with those projects. These signal timing improvements have been included in the analysis of this intersection for No-Build and Build conditions. These capacity analysis results for 2022 No-Build and Build conditions with the timing improvements indicate that the intersection is expected to operate at an overall Level of Service “C” during the AM Peak Hour and at an overall Level of Service “D” during the PM Peak Hour under future conditions both with and without the River Ridge project.

2. NYS Route 9D and Main Street/Municipal Place

Main Street intersects NYS Route 9D at a signalized full movement intersection opposite Municipal Place. The eastbound Municipal Place approach consists of a shared left, through and right turn lane. The westbound Main Street approach consists of a shared left and through lane and a right turn lane. The northbound NYS Route 9D approach consists of a left turn lane and shared through and right turn lane. The southbound NYS Route 9D approach also consists of a left turn lane and shared through and right turn lane. There are sidewalks on the west side of Municipal Place, as well as on both sides of each of the other intersection approaches. Signalized pedestrian crossings are provided on the northbound and westbound approaches while an unsignalized pedestrian crossing is provided on the eastbound approach.

Capacity analysis was conducted for this intersection utilizing the 2017 Existing Traffic Volumes. The analysis results indicate that the intersection is currently operating at an overall Level of Service “A” during the AM Peak Hour and at an overall Level of Service “B” during the PM Peak Hour.

The capacity analysis was recomputed using the 2022 No-Build and Build Traffic volumes. These results indicate that the intersection is expected to operate at an overall Level of Service “B” during the AM and PM Peak Hours under both the No-Build and Build scenarios.

3. NYS Route 9D and Rombout Avenue/Site Access

Rombout Avenue intersects NYS Route 9D at an unsignalized “T” shaped intersection. The westbound Rombout Avenue approach consists of a shared left and right turn lane and is controlled by a “Stop” sign. The northeast bound NYS Route 9D approach consists of a shared through and right turn lane along with a two-way left turn lane. The southwest bound NYS Route 9D approach consists of a through lane and a two-way left turn lane. There are sidewalks on both sides of the NYS Route 9D approaches along with a crosswalk on the east side of NYS Route 9D crossing Rombout Avenue.

Capacity analysis was conducted for this intersection utilizing the 2017 Existing Traffic volumes. The analysis results indicate that the intersection is currently operating at a Level of Service “A” during the AM Peak Hour and at a Level of Service “B” or better during the PM Peak Hour. The analysis was recomputed with the 2022 No-Build Traffic volumes, which indicates that the intersection would operate at a Level of Service “B” during each of the peak hours without the proposed River Ridge development.

The proposed Site Access will align opposite Rombout Avenue forming a four-way unsignalized intersection. The Site Access driveway will consist of one entry and one exit lane and the driveway will be controlled by a “Stop” sign. It should be noted that there is an existing curb cut on the west side of Route 9D in the vicinity of the proposed driveway location that will be reconstructed to accommodate the proposed driveway connection. The analysis of this intersection was recomputed with the 2022 Build Traffic volumes and proposed intersection configuration. The analysis indicates a Level of Service “B” will be maintained during the AM Peak Hour while a Level of Service “C” will be experienced during the PM Peak Hour.

The sight distances at the proposed driveway location were also analyzed. Based on field measurements, the existing sight distances are approximately 350 feet looking both left (north) and right (south) from the proposed access. Based on American Association of State Highway and Transportation Officials (AASHTO) criteria the stopping sight distance (200 feet) and intersection sight distance (335 feet) for the 30 MPH posted speed limit along Route 9D will be satisfied. Available NYSDOT speed

data for Route 9D in this area indicates that the 85th percentile speeds are approximately 37 to 38 MPH. For a 40 MPH design speed, AASHTO requires a minimum 305 foot stopping sight distance to allow for the safe operation of the intersection. This required stopping sight distance will also be satisfied. It should be noted that some pruning/clearing of vegetation immediately north of the proposed driveway location on the west side of Route 9D should be completed in order to maximize the sight distance looking to the north from the site driveway.

G. POTENTIAL FUTURE AREA TRAFFIC IMPROVEMENTS

According to the City of Beacon Comprehensive Plan adopted by the City on December 17, 2007 and the Beacon Transportation Linkages Program Final Report dated July 2008, there are several potential future area traffic and transportation improvements and recommendations in the study area of this proposed site. These include:

- Developing long-term plans for improvement of Route 9D between Beekman Street and the intersection with Interstate 84 to handle increased traffic capacity.
- Considering the installation of traffic calming features, such as raised crosswalks, on major roads and collector roads, including but not limited to Beekman Street and West Main Street.
- Improving access and capacity to the Waterfront/Train Station area. This may be achieved through additional turning lanes, potential new roads, and improved public transportation.
- Working closely with the County to identify new bus routes and opportunities to increase the frequency of bus service. Bus service should be improved by expanding the transit network throughout the City, more effectively linking the City to the rest of southern Dutchess County. Bus links should target the Waterfront/Train Station area along with other areas.
- Working with Dutchess County to establish funding mechanisms that would enable a free or low-cost trolley to be available at frequent intervals between points along Main Street and the train/bus/ferry station.
- Exploring the potential feasibility of establishing passenger service from the Beacon Train Station at the waterfront to the east end of Main Street via the Fishkill Creek railroad, using vehicles that can travel on both rail and road.
- Actively seeking an advisory role in planning long distance transportation improvements with federal and state organizations. The potential local traffic impact of such improvements should be considered. Such planning may involve transit links to Stewart airport, future Metro-North service, and Amtrak service. In addition, the

City should encourage Metro-North to consider the feasibility of an additional station in the vicinity to reduce traffic impacts in Beacon.

- Advocating for the development and improvement of satellite commuter parking with bus service to the Beacon station. Improvements include facility location(s), physical site improvements, and improved incentives, such as tickets inclusive of bus and parking service at discounted rates.
- Considering developing bike lanes on the Route 9D from Interstate 84 to South Avenue and also Beekman Street.
- The issuance of a Request for Expression of Interest (RFEI) for private developers to signal their interest for Transit Oriented Development (TOD) near the Beacon station.

IV. SUMMARY AND CONCLUSION

Similar Levels of Service and delays will be experienced at the area intersections under the future No-Build and Build Conditions as indicated in the above analysis. The River Ridge residential development's traffic is not expected to cause any significant impact in traffic operating conditions in the vicinity of the site. The site access driveway connection should be constructed to maximize sight distances for entering and exiting vehicles with appropriate pruning/clearing of vegetation immediately north of the proposed driveway location. The proximity of the site to the Beacon Metro-North train station makes it likely that actual traffic volumes generated by the project will be less than evaluated in this report as a portion of the trips generated will actually be pedestrian trips to and from the train. The ability to provide a more direct pedestrian connection directly to Beekman Street in the vicinity of River Street should be explored in order to facilitate improved pedestrian access to and from the train station.

RIVER RIDGE RESIDENTIAL DEVELOPMENT

APPENDIX C

LEVEL OF SERVICE STANDARDS

LEVEL OF SERVICE STANDARDS

LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS

Level of Service (LOS) can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach. Control delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control. It is also a measure of driver discomfort and fuel consumption. The volume-to-capacity ratio quantifies the degree to which a phase's capacity is utilized by a lane group.

LOS A describes operations with a control delay of 10 s/veh or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B describes operations with control delay between 10 and 20 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C describes operations with control delay between 20 and 35 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate.

LOS D describes operations with control delay between 35 and 55 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long.

LOS E describes operations with control delay between 55 and 80 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long.

LOS F describes operations with control delay exceeding 80 s/veh or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long.

A lane group can incur a delay less than 80 s/veh when the volume-to-capacity ratio exceeds 1.0. This condition typically occurs when the cycle length is short, the signal progression is favorable, or both. As a result, both the delay and volume-to-capacity ratio are considered when lane group LOS is established. A ratio of 1.0 or more indicates that cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 s/veh represents failure from a delay perspective).

The Level of Service Criteria for signalized intersections are given in Exhibit 18-4 from the *2010 Highway Capacity Manual* published by the Transportation Research Board.

Exhibit 18-4

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c ≤ 1.0	v/c > 1.0
≤10	A	F
>10-20	B	F
>20-35	C	F
>35-55	D	F
>55-80	E	F
>80	F	F

For approach-based and intersection wide assessments, LOS is defined solely by control delay.

LEVEL OF SERVICE CRITERIA

FOR TWO-WAY STOP-CONTROLLED (TWSC) UNSIGNALIZED INTERSECTIONS

Level of Service (LOS) for a two-way stop-controlled (TWSC) intersection is determined by the computed or measured control delay. For motor vehicles, LOS is determined for each minor-street movement (or shared movement) as well as major-street left turns. LOS is not defined for the intersection as a whole or for major-street approaches.

The Level of Service Criteria for TWSC unsignalized intersections are given in Exhibit 19-1 from the *2010 Highway Capacity Manual* published by the Transportation Research Board.

Exhibit 19-1

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c ≤ 1.0	v/c > 1.0
0-10	A	F
>10-15	B	F
>15-25	C	F
>25-35	D	F
>35-50	E	F
>50	F	F

The LOS criteria apply to each lane on a given approach and to each approach on the minor street.

LOS is not calculated for major-street approaches or for the intersection as a whole.

As Exhibit 19-1 notes, LOS F is assigned to the movement if the volume-to-capacity ratio for the movement exceeds 1.0, regardless of the control delay.

The Level of Service Criteria for unsignalized intersections are somewhat different from the criteria for signalized intersections.

LEVEL OF SERVICE CRITERIA

FOR ALL-WAY STOP-CONTROLLED (AWSC) UNSIGNALIZED INTERSECTIONS

The Levels of Service (LOS) for all-way stop-controlled (AWSC) intersections are given in Exhibit 20-2. As the exhibit notes, LOS F is assigned if the volume-to-capacity (v/c) ratio of a lane exceeds 1.0, regardless of the control delay. For assessment of LOS at the approach and intersection levels, LOS is based solely on control delay.

The Level of Service Criteria for AWSC unsignalized intersections are given in Exhibit 20-2 from the *2010 Highway Capacity Manual* published by the Transportation Research Board.

Exhibit 20-2

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	v/c \leq 1.0	v/c $>$ 1.0
0-10	A	F
>10-15	B	F
>15-25	C	F
>25-35	D	F
>35-50	E	F
>50	F	F

For approaches and intersection wide assessment, LOS is defined solely by control delay.
